Art Unit: 2137

DETAILED ACTION

1. Claims 1-17 are pending in this application and have been examined.

Priority

2. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1, 3-5, and 7-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Subramaniam, International Application WO 01/59545 A3, and Boesch et al., US 5,870,473.

As for claim 1, Subramaniam teaches a method for communication via a computer network (Abstract), the method comprising: registering a plurality of users with a trusted body (Detailed Description: page 2 paragraph 2); verifying the identity of each user (Detailed Description: page 4 paragraph 1 and 5); the trusted body keeping a confidential record of the relation between the identity of

Art Unit: 2137

a user and the random identifier (Detailed Description: page 2 bottom paragraph: the web server is secure against unauthorized access, page 4 paragraph 7: the account info is stored with the user's assigned PIN); wherein a user can enter into a dialogue with one or more other users by means of messages sent over the computer network and via the trusted body (Abstract, Detailed Description page 3 paragraphs 5-7), and a user remains anonymous through use of its identifier (Detailed Description page 4 paragraph 7: PIN) until such time as the user reveals its identity to one or more of the other users (Abstract, Detailed Description page 3 paragraph 7); and wherein the method includes recording the dialogue and using the recorded dialogue together with the confidential record of the relation between the identity of a user and the random identifier to provide a means of non-repudiation of the dialogue by users (Detailed Description: page 6 paragraph 2 posted messages are stored on the web server, page 7 paragraph 8: transaction messages are posted and stored on the web server, page 8 paragraph 8, page 8 paragraph 9). Subramaniam does not explicitly teach generating a user identifier that is a random number for each user. However Boesch et al. does teach this feature (col. 35 lines 45-50). Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate this feature of Boesch into the system of Subramaniam. It would have been desirable to do so since generation of a PIN that is a random number would increase the security of the system of Subramaniam by making it more difficult for an unauthorized person to guess at a client's PIN. Additional motive to make this combination is found for example at the Detailed Description of

Art Unit: 2137

Subramaniam: page 14 paragraph 5 where anonymity is taught as a major advantage of his system. A PIN that is a random number would enhance such.

As for claim 3, Subramaniam teaches a method as claimed in claim 1, wherein the trusted body verifies the suitability of a user to participate in a dialogue (Detailed Description page 9 paragraph 7, 14 paragraph 4: users are prompted to log in to the system, i.e. be authenticated, prior to posting messages. Without login, users can only browse a public message board).

As for claim 4, Subramaniam teaches the method as claimed in claim 1, but not an additional step wherein the trusted body verifies the authenticity of a message sent by a user. However Boesch does teach such a step (col. 15 lines 49-57). Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate this feature into the system of Subramaniam. It would have been desirable since this would make it more difficult for an unauthorized person to gain unauthorized access to the system.

As for claim 5, the combination of Subramaniam and Boesch teach a method as claimed in claim 4, but not one wherein the trusted body uses public key cryptography to authenticate messages sent by a user. However Official Notice may be taken that the use of such a step is old and well known in the art. Therefore it would have been obvious to one of ordinary skill in the art to incorporate this step into the system of Subramaniam and Boesch. It would have

Art Unit: 2137

been desirable to do so since this would increase the security of the system by making it more difficult for an unauthorized person to gain unauthorized access to a user's account.

As for claim 7, Subramaniam teaches a method as claimed in claim 1, wherein the dialogue is in real time (Detailed Description page 9 paragraph 5, the system notifies a recipient in real-time that a message has been posted to them).

As for claim 8, Subramaniam teaches a method as claimed in claim 1, wherein the trusted body prescribes a set of rules to be followed by the users (Detailed Description page 9, final paragraph, the privacy agent enforces a rule against disclosure of the user's personal information to the "public" side of the bulletin boards).

As for claim 9, Subramaniam teaches a method as claimed in claim 1, wherein, the users can be any of: individuals, corporate bodies, organizations, automated machines or software applications (Abstract: individual user's are taught).

As for claim 10, Subramaniam teaches a method as claimed in claim 1, wherein a message from a user is sent to an input queue to ensure the correct order of the messages handled by the trusted body (Detailed Description page 6 paragraph 2).

Art Unit: 2137

As for claim 11, Subramaniam teaches a method as claimed in claim 1, wherein messages can include attachments in the form of documents to be discussed in the dialogue between users (Detailed description page 9 paragraph 6).

As for claim 12, the combination Subramaniam and Boesch teaches a method as claimed in claim 11, but not one wherein the attachments are signed or watermarked. However Official Notice may be taken that the implementation of such a step is one that is old and well known in the art. Therefore it would have been obvious to one of ordinary skill in the art to incorporate this step into the system of Subramaniam and Boesch. It would have been desirable to do so since this would increase the security of the system by making it more difficult for an unauthorized person to alter a visual or other depiction of an item being sold to the disadvantage of the seller.

As for claim 13, the claim is directed towards the system that carries out the method of claim 1 and it contains substantially the same limitations as claim 1. Therefore claim 13 is rejected on the same basis as claim 1.

As for claim 14, Subramaniam teaches a system as claimed in claim 13, wherein the computer network is the Internet and the trusted body is an Internet

Art Unit: 2137

service provider (Abstract, Background of the Invention: instant messaging service).

As for claim 15, Subramaniam teaches a system as claimed in claim 13, wherein each user has a graphical user interface showing the dialogue and status of the other users (Detailed Description page 2 second to last paragraph: users interact through accessing a web portal, therefore a GUI is inherent to the system).

As for claim 16, Subramaniam teaches a system as claimed in claim 15, wherein the graphical user interface includes a means for viewing a document sent by a user as an attachment to a message of the dialogue (Detailed Description page 3 paragraph 4).

As for claim 17, the claim is directed towards the computer program, embodied in a memory medium, that when read out causes the apparatus of claim 13 to carry out the method of claim 1. The claim has substantially the same limitations as claim 1 and is therefore rejected on the same basis.

5. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Subramaniam and Boesch as applied to claim 1 above, and further in view of McLaughlin, International Application WO 00/01108 A3.

Art Unit: 2137

The combination of Subramaniam and Boesch teaches the method presented in claim 1, but not with the additional step of verifying the identity of a user by validating a public key certificate for a user. However, McLaughlin does teach this feature (Specification page 11 paragraph 2). Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate this feature into the system of Subramaniam and Boesch. It would have been desirable to do so since authentication by public key certificate would increase the security of the system of Subramaniam by making it more difficult for an unauthorized person to guess at a client's login data. Additional motive to make this combination is found for example at the Detailed Description of Subramaniam: page 14 paragraph 5 where anonymity is taught as a major advantage of his system. Such would be enhanced by use of a public key certificate for login since, in the case of McLaughlin, the web server creates it for the user and it need not contain any user-identifiable data.

6. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Subramaniam and Boesch as applied to claim 1 above, and further in view of Walker et al., US 5,794,207.

The combination of Subramaniam and Boesch teach a method as claimed in claim 1, but not one wherein the trusted body time-stamps all messages from users when recording the dialogue formed by the messages between users.

However Walker does teach this step (figure 7, col. 9 lines 19-21). Therefore it would have been obvious to one of ordinary skill in the art at the time of the

Art Unit: 2137

invention to incorporate this feature into the system of Subramaniam and Boesch. It would be desirable to do so since this would offer the user the ability to prove the time at which an offer to buy or sell was posted.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The following US Patent documents teach systems for user authentication and access to web resources similar to the claimed invention:

Spalink et al.

US 6,983,379 B1

Gudjonsson et al.

US 6,564,261 B1

Teper et al.

US 5,815,665

Fisher

US 6,957,199 B1

Kirsch

US 5,963,915

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul E. Callahan whose telephone number is (571) 272-3869. The examiner can normally be reached on M-F from 9 to 5.

Art Unit: 2137

If attempts to reach the examiner by telephone are unsuccessful, the Examiner's supervisor, Emmanuel Moise, can be reached on (571) 272-3865. The fax phone number for the organization where this application or proceeding is assigned is: (571) 273-8300.
